**Title of the Invention**

**Mount Aggregate Having Torque Supporting Function**

**Abstract**

A mount aggregate includes at least a support body (6) used for supporting a vertical load. The support body, severing as a ring core support body, is a one of elements for torque support in the mount aggregate. For this purpose, the ring core support body (6) is supported to a vehicle (5) and is provided with an elastic ring core (10) surrounded by a ring-shaped member (16) that supports the force in the radial direction. The elastic ring core (10) is geometrically designed so as to have a characteristic for supporting force different in direction, i.e., force in the vertical direction and force in the radial direction.
